## **Introduction**

In August 2019, the **A.L. Burruss Institute of Public Service and Research** at **Kennesaw State University** conducted the “Metro Atlanta Speaks” survey on behalf of the **Atlanta Regional Commission** (ARC). A total of 5,450 adult residents across 13 counties in the metro area were surveyed by telephone<sup>1</sup>. The survey incorporated both landline and cellphone telephone samples. Four hundred (400) completions were obtained in each of 10 counties; in Butts County, only 250 completions were obtained due to sampling limitations. Respondents in DeKalb and Fulton counties were oversampled in order to obtain a separate sample of 400 residents of the City of Atlanta. The final respondent total for DeKalb County was 524 (124 in the city of Atlanta), while the final respondent total for Fulton County was 676 (276 in the city of Atlanta). Thus, a subset of Atlanta residents is available for separate analysis. Analyses of the metro-wide data, as well as the individual results for Fulton and DeKalb counties, treat Atlanta residents as members of their respective counties. The results for the City of Atlanta included in the accompanying tables are based on a separate analysis of the subset of respondents from those two counties.

---

<sup>1</sup> Included in the survey were the 10 counties in the ARC’s service region (Cherokee, Clayton, Cobb, DeKalb, Douglas, Fayette, Fulton, Gwinnett, Henry and Rockdale counties) in addition to Butts, Coweta and Paulding counties.

The table below provides a breakdown of the number of landline and cellphone completions obtained in each county.

County	Landline Completions	Cellphone Completions	Total
Butts	79	171	250
Cherokee	193	207	400
Clayton	168	232	400
Cobb	217	183	400
Coweta	235	165	400
DeKalb	284	240	524
Douglas	166	234	400
Fayette	245	155	400
Fulton	384	292	676
Gwinnett	182	218	400
Henry	235	165	400
Paulding	161	239	400
Rockdale	172	228	400
Total (%)	2721 (50%)	2729 (50%)	5450

The four hundred completions in each of the 10 larger counties (not including DeKalb and Fulton) and the city of Atlanta resulted in a margin of error (MOE) within each of those entities of  $\pm 5\%$ . For DeKalb County, the MOE is  $\pm 4.3\%$ ; in Fulton the MOE is  $\pm 3.8\%$ . Results for Butts County have a MOE of  $\pm 7\%$ . For the metro region as a whole, the MOE is  $\pm 1.3\%$ .

Within each individual county, the data was weighted to reflect a county's adult population distribution on gender, age, race, education and whether or not the respondent is Hispanic or Latino. In addition, the data for the counties of DeKalb, Douglas, Fulton and Rockdale and the City of Atlanta were weighted according to whether or not the respondents live north or south of Interstate 20. After the data for all of the counties were weighted for these factors, the data was combined and then weighted to reflect the relative distribution of the population across the 13 counties. For the separate analyses of city of Atlanta residents, the respondents were weighted for the same characteristics as the individual counties with an additional weighting factor to reflect the City of Atlanta's relative population distribution across DeKalb and Fulton counties.

Frequency distributions for each substantive question and the demographic characteristics of the metro-wide sample are provided below. These are followed by a series of tables comparing the responses to each question by the various demographic subgroups.

In regards to the comparison of demographic subgroups, ***most of the results are statistically significant at the .01 level. Results in normal black text meet this level of statistical significance.*** Results expressed in **green text** are statistically significant at a level between .01 and .05, while results in **red text** do not meet the .05 minimum threshold for statistical significance. Statistical significance simply indicates the probability that observed differences between subgroups on any given question are a function of chance rather than some real relationship between the two variables. Observed differences that are significant at the .05 level means that there is only a 5% probability that the observed differences are a function of random chance. A .01 significance level means that there is only a 1% probability of the observed differences being a function of chance.

The survey instrument is provided in the Appendix at the end of this document.
