Introduction

In August 2025, the **A.L. Burruss Institute of Public Service and Research** at **Kennesaw State University** conducted the “Metro Atlanta Speaks” survey on behalf of the **Atlanta Regional Commission** (ARC). A total of 4,121 adult residents across eleven counties in the metro area were included in the 2025 survey¹. The multi-mode survey incorporated both landline and cellphone samples in addition to an online panel component. The online panel consisted of a total of 1,496 respondents across the eleven counties (see *Table 1*), accounting for 36% of the entire sample. Cellphone respondents comprised 48% of the overall sample, with the remaining 15% contacted via landline telephones. The margins of error for the sample in each geography are included as well.

Table 1: Online and Telephone Respondents (by Type) by County

County	Online Survey	Landline Completions	Cellphone Completions	Total	Margin of Error
Cherokee	49	41	221	311	± 5.7%
Clayton	55	56	192	303	± 5.7%
Cobb	219	30	152	401	± 4.9%

Fayette	15	72	215	302	± 5.6%
Forsyth	35	76	197	308	± 5.7%
Fulton	417	92	166	675	± 3.8%
Gwinnett	240	34	131	405	± 4.9%
Henry	40	70	192	302	± 5.6%
Rockdale	20	70	211	301	± 5.6%
Metrowide (%)	1496 (36.3%)	633 (15.4%)	1992 (48.3%)	4121	± 1.5%

Respondents in DeKalb and Fulton counties were oversampled compared to other geographies in order to obtain a sub-sample of residents of the City of Atlanta (n = 401). The final respondent total for DeKalb County was 510 (108 in the city of Atlanta), while the final respondent total for Fulton County was 675 (295 in the city of Atlanta). Thus, a subset of Atlanta residents is available for separate analysis. Analyses of the metro-wide data, as well as the individual results for Fulton and DeKalb counties, treat Atlanta residents as members of

¹ Included in the survey were the 11 counties in the ARC’s service region: Cherokee, Clayton, Cobb, DeKalb, Douglas, Fayette, Forsyth, Fulton, Gwinnett, Henry and Rockdale counties.

their respective counties. The results for the City of Atlanta included in the accompanying tables are based on a separate analysis of the subset of respondents from those two counties. The margin of error for the sample of City of Atlanta residents is $\pm 4.9\%$.

Prior to the metro-wide analyses, the data within each county were weighted to reflect the county's adult population distribution on gender, age, race, education and whether or not the respondent is Hispanic or Latino. After the data for all of the counties were weighted for these factors, the data was combined and then weighted to reflect the relative distribution of the population across the eleven counties. For the separate analyses of city of Atlanta residents, the respondents were weighted for the same characteristics as the individual counties with an additional weighting factor to reflect the City of Atlanta's relative population distribution across DeKalb and Fulton counties.

Comparison of Demographic Characteristics of Online and Telephone Respondents

A comparison of online and telephone respondents on selected demographic characteristics reveals that the online panel component provides significantly better access to younger (ages 18-44) respondents than does the telephone component (*see Table 2*). On the other hand, the gender split among telephone respondents only slightly favors women, while they make up a much larger percentage (65%) of the online respondents. Finally, the percentage of respondents in the telephone component of the survey who are 65 years of age or older is significantly larger than the corresponding percentage among online respondents (36.6% to 20.8% respectively). This difference is the result of the fact that almost one-quarter of the phone completions were obtained from people who have landline telephones, and over eighty percent (83.6%) of those respondents are age 65 or older since that cohort is far more likely than younger generations to have a landline telephone in their household.

Individual Item Frequencies and Cross-tabulations

Weighted frequency distributions for each substantive question and the demographic characteristics of the metro-wide sample are provided below. These are followed by a series of tables comparing the responses to each substantive question by the various demographic subgroups.

In regards to the comparison of demographic subgroups, ***most of the results are statistically significant at the .01 level. Results in normal black text meet this level of statistical significance.*** Results expressed in **green text** are statistically significant at a level between .01 and .05, while results in **red text** do not meet the .05 minimum threshold for statistical significance. Statistical significance simply indicates the probability that observed differences between subgroups on any given question are a function of chance rather than some real relationship between the two variables. Observed differences that are significant at the .05 level means that there is only a 5% probability that the observed differences are a function of random chance. A .01 significance level means that there is only a 1% probability of the observed differences being a function of chance.

The survey instrument is provided in the Appendix at the end of this document.

2025 Metro Atlanta Speaks Survey

“This is XXXX calling on behalf of Kennesaw State University. We’ve been asked to talk to residents in the area to get their opinions about a number of issues related to quality of life in metro Atlanta. I’d like to assure you that this is not a sales call. The survey is voluntary and should take approximately 10 minutes. Your responses will remain anonymous; you will not be identified in any way. Can we take a few minutes to discuss these issues?

(Assuming the respondent agrees to continue):
Are you at least 18 years of age or older?”
If no – thank the person and terminate.
